IT Service Management

Objective:
To cover incident management walkthrough and drive customer experience through ServiceNow

AGENDA:

- ✓ Incident Management lifecycle
- ✓ Incident Management walkthrough
- ✓ Incident States
- ✓ Priorities identification and differentiators
- ✓ ServiceNow Platform Architecture
- ✓ Benefits of ServiceNow
- ✓ Conclusion
- ✓ Appendix

Incident Management lifecycle

An incident is an event that could lead to loss of, or disruption to, an organization's operations, services or functions.
Incident management is **a term describing the activities of an organization to identify, analyze, and correct hazards to prevent a future re-occurrence**.

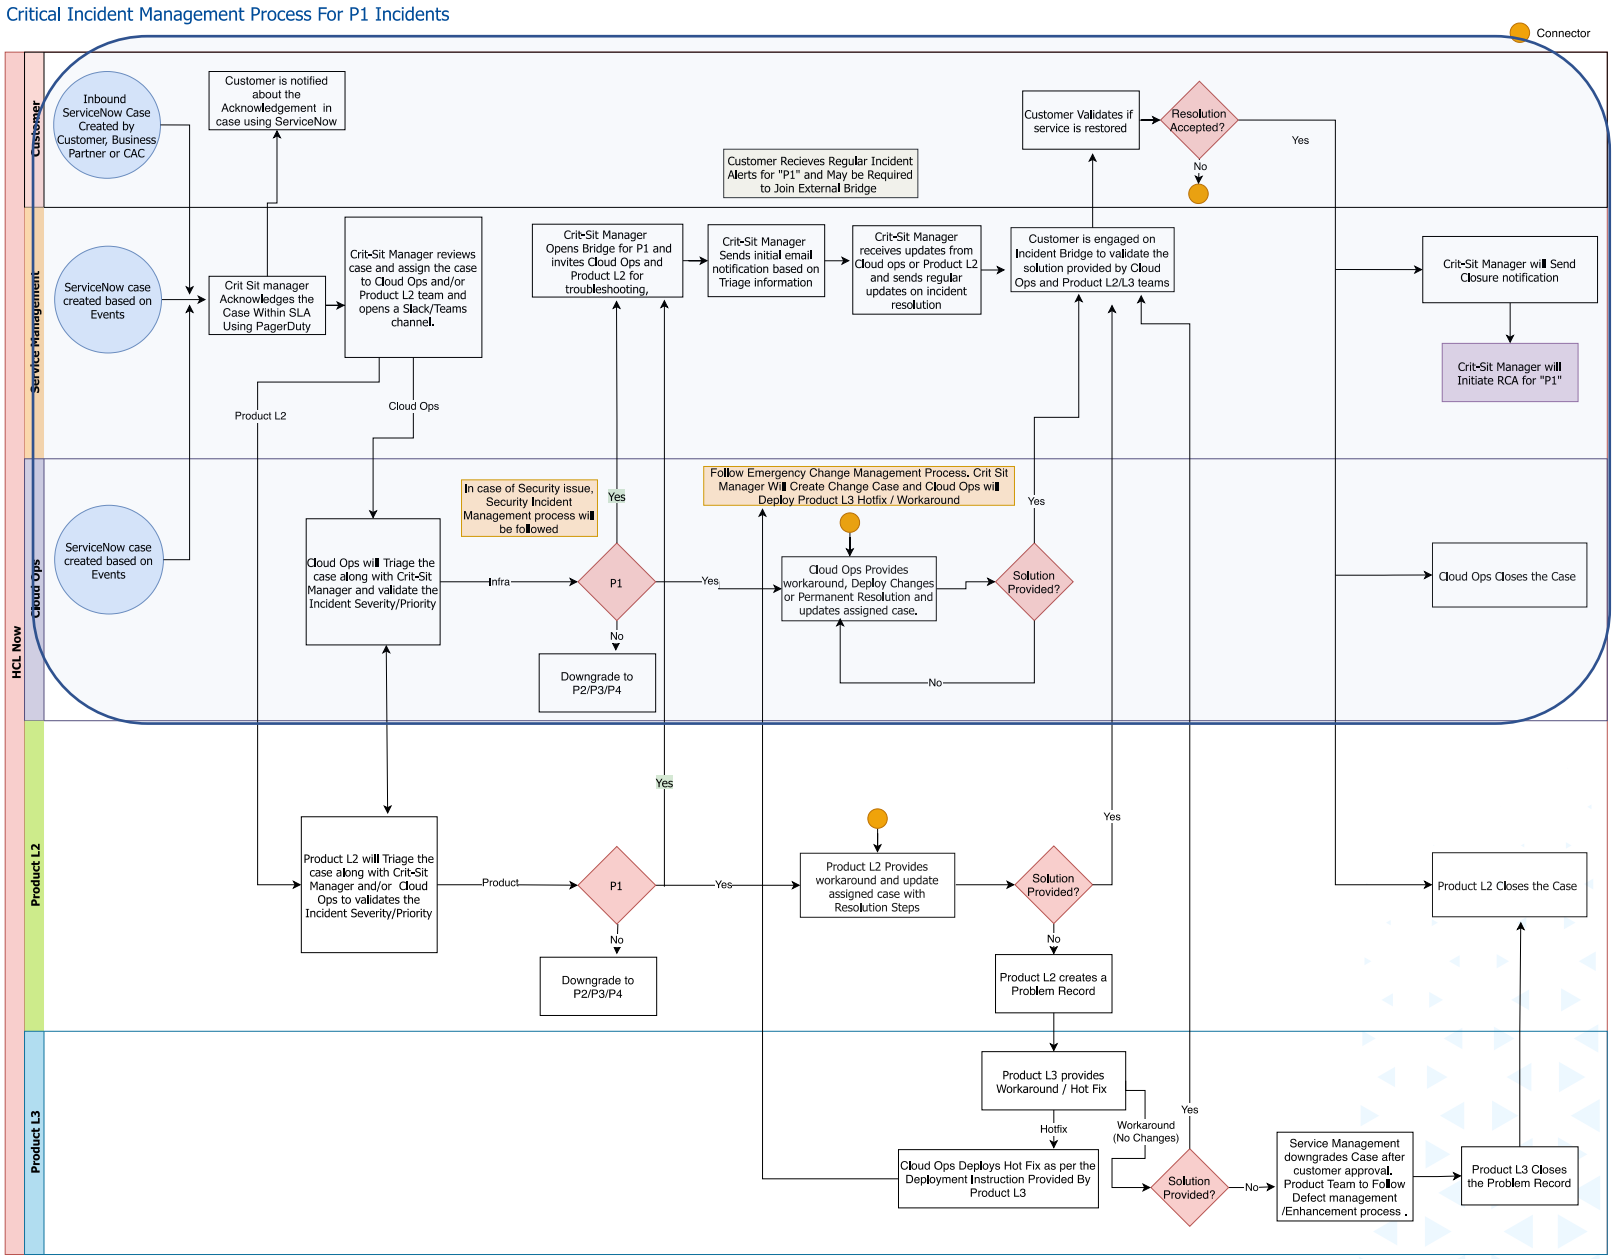
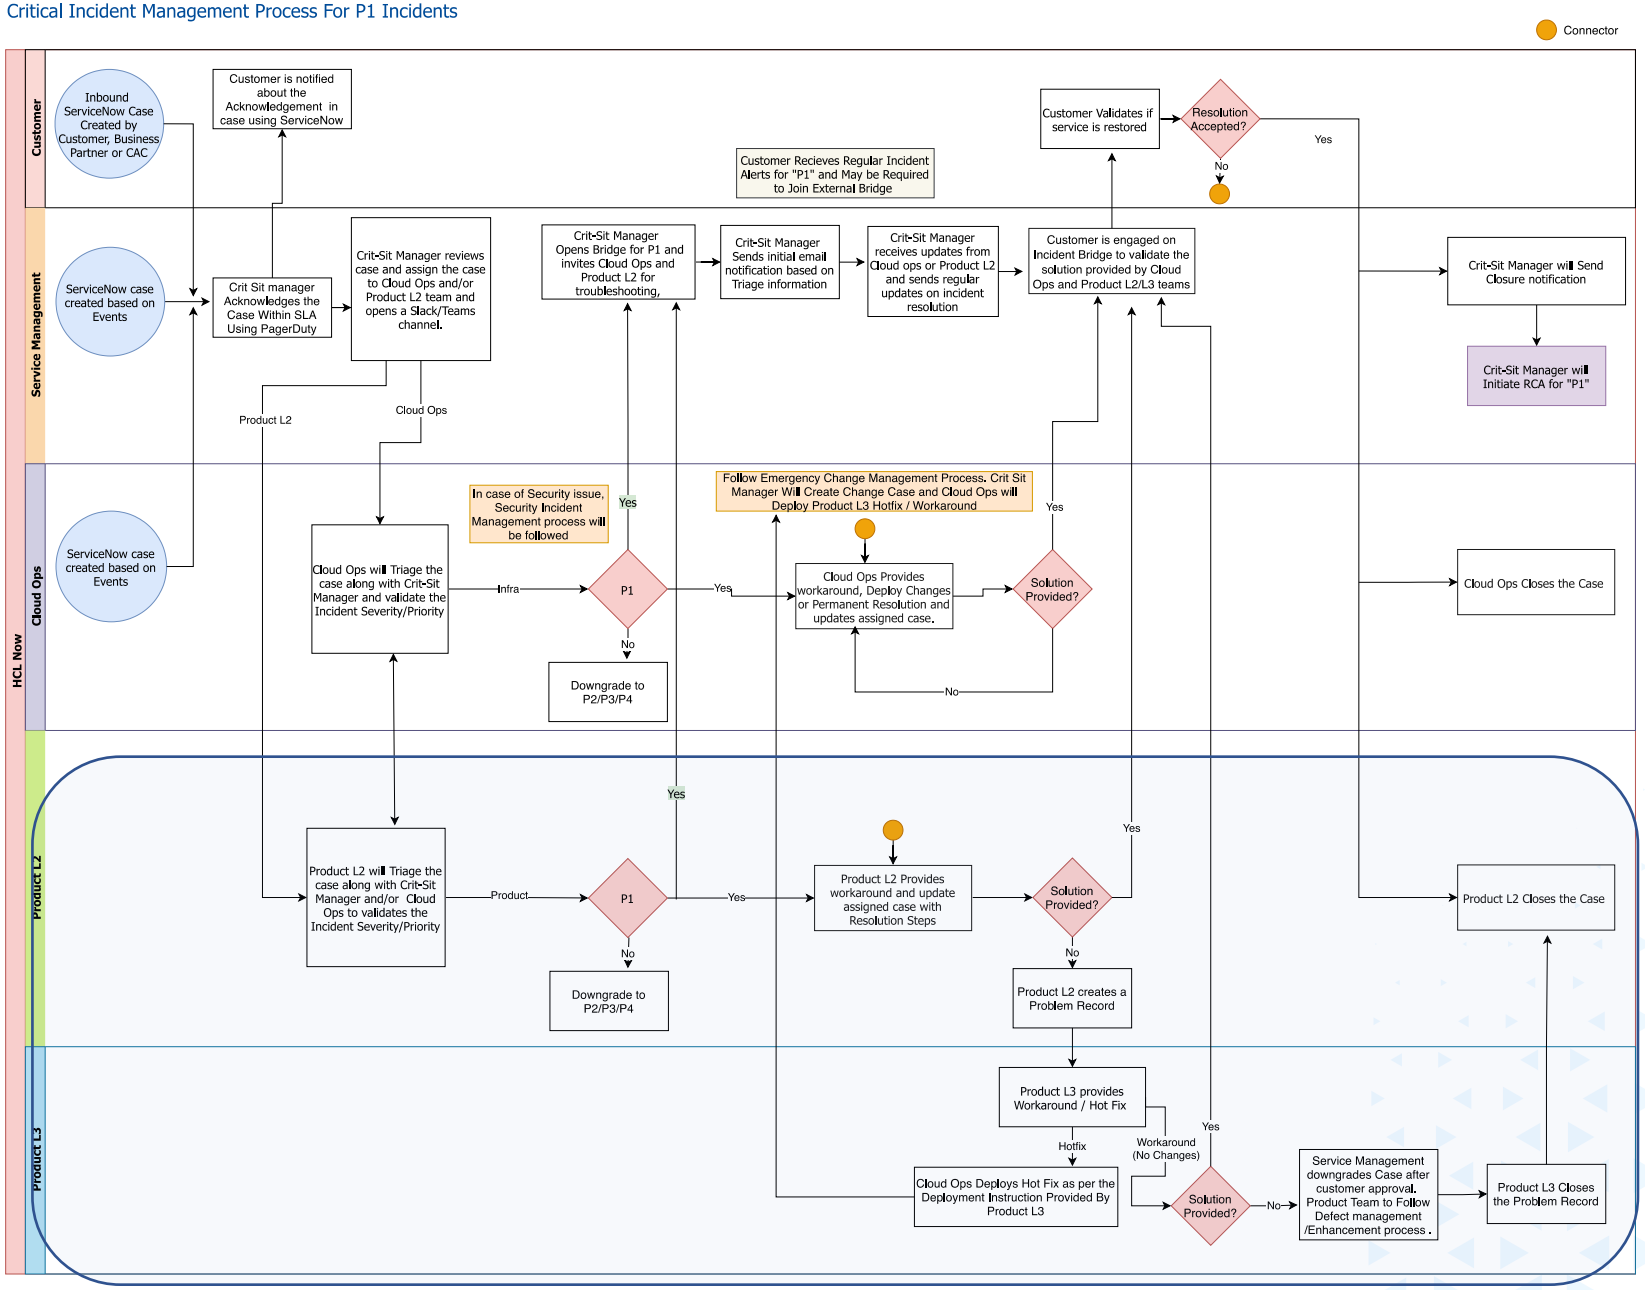
Critical Incident Management Process Flow (Infra)



- Once a case is received as a P1, one of the Incident Manager from service management team will be notified by the following:
  - Call, SMS, Email, PagerDuty and Slack
- Incident Manager will acknowledge the case for SLA to stop. Which will trigger a mail from SNOW to the customer. Additionally, we will also share outlook email with a predefined template to various stakeholders for example leadership team etc. We will be sharing these further to provide update on the issue as well as for closure
- After initial triaging along with Cloud Ops, the Incident Manager will assign it to either App Ops-Cloud Ops/Network or DBA and open a team's bridge to collaborate with involved support teams and customer if required to clarify concerns.
- Once issue is resolve, Incident Manager will validate the same with customer along with support team and further close the case.
- For any assistance from product L2 team on above scenario, Cloud Ops to open a PRB for them so that it could be tracked. Both teams will interact on Teams channel for Product L2 Support.

Critical Incident Management Process Flow (Product L2/L3)

Critical Incident Management Process For P1 Incidents



- After initial triaging if Incident Manager and Cloud Ops confirm that it is a L2 issue. Incident Manager will assign the case to product L2 team.
- Product L2 team will work on the solution and during the resolution they required any help from Cloud Ops such as logs, File etc. they will open a PRB.
- For any assistance from L3. L2 will open a PRB for L3.
- In case if hotfix provided by L3 which will be considered as an emergency change and will be deployed by Cloud Ops team.
- For any Hotfix/workaround provided, same would be validated with customer along with support team and the case will be closed.
- In case no workaround possible Incident Manager will downgrade the priority after discussion with customer and it will move to defect management/enhancement request.
- L3 will close the PRB, and case will be closed.
- Incident Manager will create a PRB and will schedules Post Incident Review/Root Cause Analysis meeting, documents and sends RCA summary and action items to stakeholders, to be completed in 10 business days

Incident States in ServiceNow

State	Description
New	Incident is logged but not yet investigated.
In Progress	Incident is assigned to support team and is being investigated.
On Hold	The responsibility for the incident shifts temporarily to another entity to provide further information, evidence, or a resolution when the incident case is put On Hold.
Resolved	A satisfactory fix is provided for the incident to ensure that it does not occur again.
Closed	Incident is marked Closed after it is in the Resolved state for a specific duration, and it is confirmed that the incident is satisfactorily resolved.
Cancelled	Incident was triaged but found to be a duplicate incident, an unnecessary incident, or not an incident at all.

Differentiator Matrix for P1, P2, P3, P4

	P1 (Sev 1)	P2 (Sev2)	P3 and P4 (Sev 3/4)
Teams Bridge	Yes	No	No
Outlook Email	Yes	No	No
RCA	Yes	If Needed	No
Notifications	Call, SMS, PD and Slack Notification	PD and Slack Notification	PD and Slack Notification
Customer Validation and Case closure	Incident Manager and Customer	Incident Manager and Customer	Incident Manager and Customer

Overview of Platform Architecture

True enterprise cloud

Single system of engagement for the enterprise

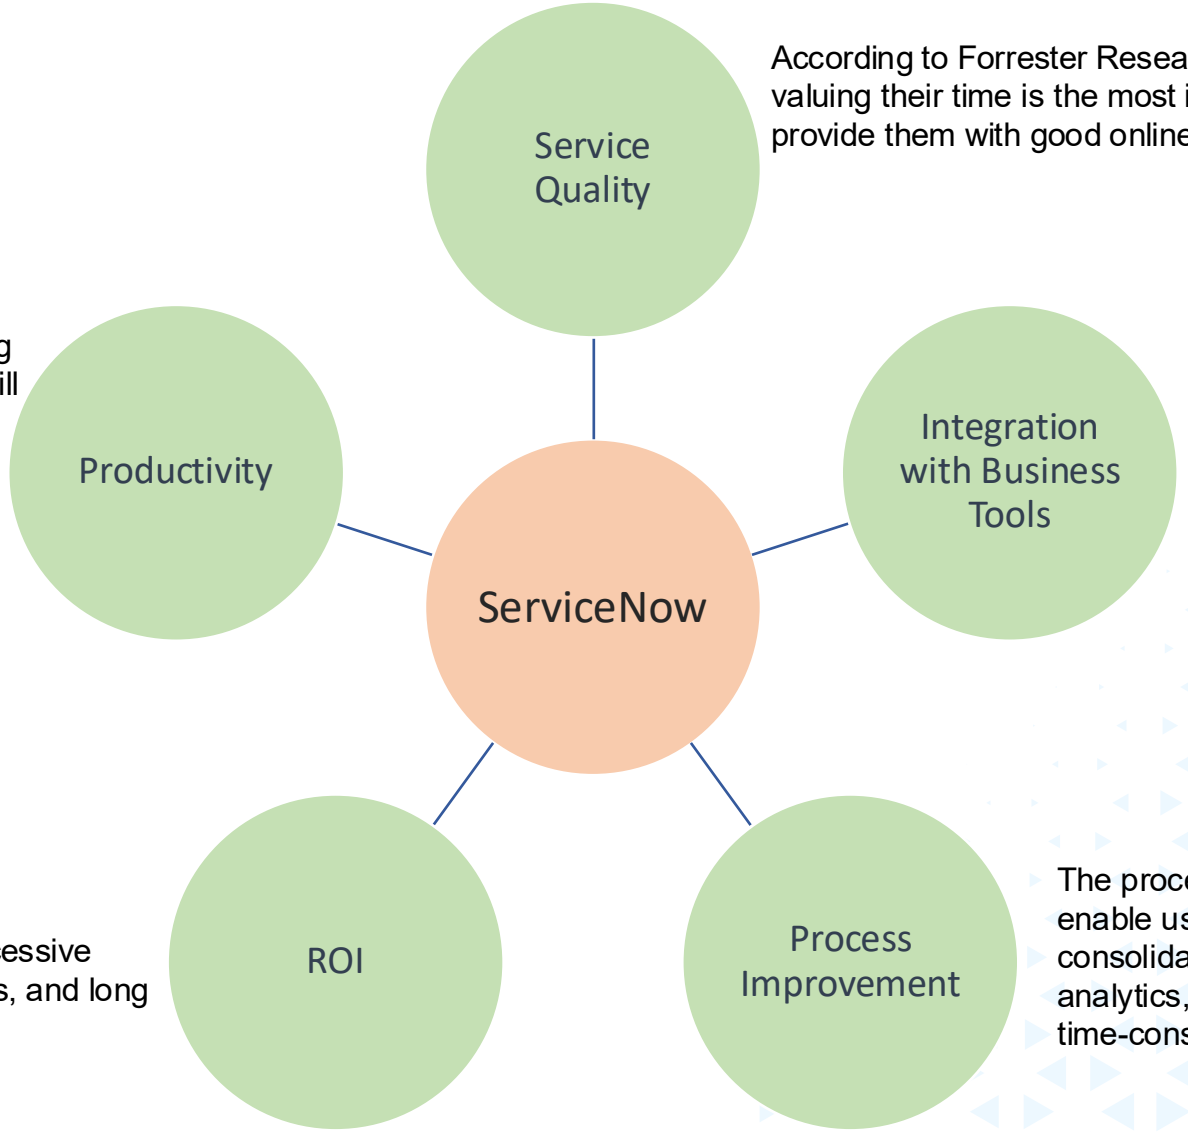
- **Application platform as a service (aPaas)**:Manage IT Strategy, Operations, Service Delivery and Apps
- **System of Action**:Automate, Predict, Digitize, Optimize and resolve risk
- **Enterprise Cloud**: The ServiceNow multi-instance architecture provides these distinct advantages: Your organization's data is truly isolated, making hardware and software maintenance on these unique customer instances easy to perform
- **Availability and Redundancy**: All ServiceNow global data centers are paired with another data center to provide redundancy with failover support. customer traffic can be quickly rerouted using our Advanced High Availability—or AHA
- **Backups and Security**: ServiceNow provides four weekly full backups of your data, with six days of daily differential backups. Data are encrypted in transit, while certifications for ISO27001, SSAE 16 SOC1 and SOC2 Type 2 attest to security, availability, and privacy in the cloud
- **Domain Separation**: Domain separation allows you to separate data, processes, and administrative tasks on an instance into logical groupings, called domains. All users have access to the global domain, but access to other domains is limited to specific users.

Benefits of ServiceNow

ServiceNow is a leading provider of cloud-based services that automate enterprise IT operations. Services includes a suite of applications built on our proprietary platform that automates workflow and provides integration between related business processes. It focus on transforming enterprise IT by automating and standardizing business processes

Ease of Use	ServiceNow replaces manual tasks with automated workflows that everyone can use in an organization in a hassle-free manner.
Process Optimization	ServiceNow for small businesses get their processes sorted and scale their operations in a better way
Faster Workflows	The platform helps organizations track each task's progress efficiently, even allowing stakeholders to automate the processes regularly.
Versatility	Scalability and handling the volume of data can be a concern. As ServiceNow is cloud-based, it does not remain tied to a particular local resource. You can scale the system to the network you desire
Improved Decision-Making	ServiceNow continues to generate insights from discrete sets of data. These insights are helpful for the top brass of the company to make pertinent decisions promptly
Efficient task management	ServiceNow's architecture is based on a multi-instance setup that aids users in managing tasks efficiently
Higher ROI	ServiceNow's architecture enables enterprises to make the most of their investments. This ROI is realized by utilizing existing systems to derive useful data, integrating several software tools and technologies
Integration	You can integrate your software tools and custom-made, third-party applications with ServiceNow.
Productivity	ServiceNow improves productivity through centralization of IT assets and automation of processes, including redundant ones
Less infrastructure Costs	ServiceNow also helps in reducing costs by overcoming downtime and service outages. There will also be reduced errors through automation, and optimized service desk and IT back-office operations.. These ServiceNow benefits helps in avoiding the need for reclaiming servers, eliminating software costs, and save valuable time for the IT team.

Conclusion



According to Forrester Research, 77% of customers say that valuing their time is the most important thing a company can do to provide them with good online customer service

Overcome problems like waiting for too long to receive approvals and responses. You will prevent productivity of your team members getting affected. Your employees will not spend more time doing tasks that do not meet the business objectives. You will ultimately start delivering better, leading to improved customer satisfaction.

The unified platform of ServiceNow brings all tools and applications at one place. There is no need for your employees to learn about separate applications for separate needs.

Helps you overcome issues like excessive implementation time, frequent errors, and long waiting periods to get resolved

The process automation tools of ServiceNow enable users to identify processes that need consolidation. With the help of performance analytics, users can also simplify complex and time-consuming processes

Appendix

Leveraging & Automating with Third Party Applications

SOC Event Management

Integrate Prisma Cloud with ServiceNow and get automatically notified about Prisma Cloud alerts through ServiceNow tickets to prioritize security incidents and vulnerabilities that impact your business

Event Monitoring Management

New Relic monitors synthetic and non synthetics alerts and could be automated to open a incident in Snow

Alert Management

Pager Duty can be integrated with above apps to notify teams without any delay apart from native app, Call and SMS.

Reporting and Dashboard

Grafana can be integrated with ServiceNow to build interactive reports with user credentials.

Escalation Management

Pager Duty helps setup escalation matrix. Page out functionality to call and SMS support staff in major outages.

Support Responsiveness

Service Guide		
Priority	**Impact And Urgency**	**Priority Definition**
P1 (Critical)	Critical Business Impact for all users Requires immediate resolution	Critical business impact/service down: Business critical functionality is inoperable or critical interface has failed. This usually applies to a Production Environment and indicates an inability to access services resulting in a critical impact on operations. This condition requires an immediate solution.
P2 (High)	Significant Business Impact for some/all users Requires prompt resolution	Significant business impact: A service business feature or function of the service is severely restricted in its use or Customer is in jeopardy of missing business deadlines.
P3 (Medium)	Minor Business Impact for some users Requires timely resolution	Minor business impact: Indicates the service or functionality is usable and it is not a critical impact on operations.
P4 (Low)	Minimal Business Impact for a few/single user Requires suitable resolution	Minimal business impact: An inquiry or non-technical request.

ServiceNow Assignment Groups

Service Management

- **XYZ Incident Management** – All Incidents for XYZ customers
- **XYZ Change Management** – All Changes for XYZ customers
- **XYZ Service Requests** – All Service Requests for XYZ customers

Product Support – L2

- **XYZ L2 Pro WW** Product L2 Support

Cloud Operations

- **XYZ AppOps – CloudOps** – Application Issues for XYZ products and customers
- **XYZ DBA – CloudOps** – Database Issues for XYZ products and customers
- **XYZ Network – CloudOps** – Network Issues for XYZ products and customers
- **XYZ Platform - CloudOps** –Platform Issues for XYZ products and customers
- **XYZ Provisioning - CloudOps** – Exxon technical issues; JJILL Commerce V9; Pladur GCP environment
